

Transport produces roughly a third of the UK's carbon emissions, and the haulage industry is often criticised for the levels of pollution and congestion it creates on the roads.

**Orion** helps organisations identify unnecessary processes within their logistics and then provides solutions that deliver real improvements and cost savings. These Solutions are designed to achieve efficiency gains through the adoption of intelligent and dynamic processes that are scalable and able to swiftly respond to change. The deployment of these solutions invariably results in greater productivity, lower energy usage and reduced Carbon emissions.

By shirking environmental responsibilities and ignoring the impact of their supply chain on the environment, companies are letting down their shareholders, staff and customers. There are significant commercial benefits to reducing your carbon footprint and perhaps the most tangible is that supply chain costs are simultaneously reduced. Therefore those businesses that tackle this issue and “Green” their logistics will demonstrate they are pursuing a policy of managed energy and emissions reduction. We enable organisations to be smarter in their management of people and resources therefore they will prosper at the expense of others.

The **Orion Star** range – makes you Miles Better.
